Coding & Solution Overview

This project utilizes ServiceNow's native out-of-the-box (OOTB) platform modules and configuration capabilities. The solution is developed through platform configuration of tables, data sources, import sets, transform maps, coalesce rules, reports, and dashboards.

1. Implementation & Configuration Steps

Step 1: Create Employee Spreadsheet

An Excel spreadsheet (.xlsx) is prepared containing employee records with exactly five columns: Employee ID, Name, Email, Department, and Location.

Step 2: Create Employee Test Table (u_employee_test)

A custom ServiceNow table named Employee Test (u_employee_test) is created via System Definition > Tables. Columns are created to correspond to the source spreadsheet fields.

Step 3: Upload Data Source & Staging

In the planned workflow, the Excel file will be loaded into ServiceNow through the System Import Sets module (System Import Sets > Load Data / Data Sources). When the file is uploaded, ServiceNow creates an import set staging table to temporarily hold the raw spreadsheet records.

Step 4: Create Transform Map with Field Mapping

A Transform Map will be configured linking the import set staging table to the target Employee Test (u_employee_test) table. The explicit field mappings to be established are:

- Employee ID -> Employee ID
- Name -> Employee Name
- Email -> Email
- Department -> Department
- Location -> Location

Step 5: Configure Coalesce for Duplicate Prevention

Coalesce will be enabled on the unique field (Employee ID) in the field map. This ensures that when data is imported, matching existing Employee IDs updates existing records in u_employee_test rather than creating duplicate entries.

Step 6: Transform Data and Verify

The Transform Map will be executed to process records from staging into u_employee_test. The import log will track row-level outcomes (inserted, updated, or skipped) for validation.

Step 7: Configure Reports and Dashboard

Reports will be configured on the Employee Test (u_employee_test) table (Report 1 by Sreehari B, and additional reports by Surya Prakash T) to summarize imported employee data. These reports will be arranged into a consolidated ServiceNow Dashboard.
