

Performance Testing

Date	30 September 2026	Maximum Marks	2 Mark(s)
Team ID	6ab6383cfa5e5219dc390031	Project Name	Import Data using Transform Maps (S

Functional & Data Validation Testing

The following 8 test cases define the planned functional and data validation tests to verify that the ServiceNow import pipeline functions correctly, raw spreadsheet data is staged, field mappings transform accurately into the target Employee Test (u_employee_test) table, coalesce prevents duplicate records, and reports/dashboards display valid data.

S.No	Test Case	Description	Expected Result	Status
1	Excel Data Source Upload	Upload employee Excel file to ServiceNow	Data source created and file attached successfully	Planned
2	Import Set Staging	Load raw spreadsheet rows into staging table	All rows from Excel file staged without loss	Planned
3	Target Table Schema	Verify Employee Test (u_employee_test) field	Custom table schema matches expected employee attributes	Planned
4	Transform Map Association	Create transform map from import set to target table	Transform map correctly links staging to u_employee_test	Planned
5	Field Mapping Accuracy	Configure and verify source-to-target field mappings	Each source column maps to corresponding target field	Planned
6	Data Transformation	Run transform and verify data conversion	Values properly transformed and populated in target table	Planned
7	Coalesce Deduplication	Re-import existing records with coalesce enabled	Existing records updated; zero duplicate records created	Planned
8	Reports & Dashboard Display	Generate reports and add to dashboard	Reports render accurately and dashboard displays widgets	Planned

Testing Summary

- These 8 functional and data validation test cases are planned and will be performed after the ServiceNow implementation is completed.
- Staging and field mapping will be verified between the import set staging table and the Employee Test (u_employee_test) table.
- Coalesce logic will be tested during import execution to confirm that re-running imports updates existing rows and avoids duplicates.
- Reporting will be validated to ensure reports and dashboard widgets display accurate records from u_employee_test.
